Hi,

We would like to take advantage of the free sequences offered by Twist through its iGEM sponsorship program. Before placing our order, we wanted to ask whether it would be possible to receive the constructs as frozen bacterial stocks (transformed into DH10B cells), which appears to be an option on the ordering site.

We would be happy to pay any additional cost associated with this option.

Thank you, and we look forward to hearing from you.

Hello Cesar,

This is Xueer from the technical support team, and I'd be happy to assist with your inquiry.

You are correct that glycerol stocks are available as an add-on option when ordering Clonal Genes. Depending on the specific vector used for cloning, the strain provided in the glycerol stock will be either DH10B-like or STBL-like cells.

If glycerol stock add-on option is selected, you will receive both the plasmid DNA and the glycerol stock from your Clonal Gene order.

Please note that glycerol stocks are not covered under the standard iGEM sponsorship program. However, you can certainly request that to have glycerol stock option selected for your order; you will just need to pay for the glycerol stock add-on separately.

Please let me know if you have any additional questions we can assist with.

Best regards,
Xueer Jiang, Ph.D.
